

Motion Planning for Recycling Robotics: Progress Report

Nicholas Link, Samuel Tormey, Ricky LeVan

January 26, 2015

Intro

- We are building a simulated robot to manipulate objects on a conveyor belt
- We were motivated by the desire to improve recycling efficiency

Review: Last Semester's Work

- First we researched the robot dynamics for a SCARA arm.
- Next we formulated our optimization problem:

$$\begin{aligned} \min \quad & T \\ \text{s.t.} \quad & \frac{d\tilde{x}(\tau)}{d\tau} = Tf(\tilde{x}(\tau), \tilde{u}(\tau)) & \tau \in [0, 1] \\ & -M \leq \tilde{u}_j(\tau) \leq M & 1 \leq j \leq 3 \\ & \tilde{x}(0) = x_0 \\ & \tilde{x}(1) = x_T \end{aligned}$$

Outline of current and future work

Current work:

- Custom Jacobian
- 3D robot animation

Future work:

- Online optimal path finding
- Temporal goal planning

Custom Jacobian

Reminder: Our dynamics can be written in the following form:

$$b = \frac{x_{i+1} - x_i}{d\tau} - Tf(x_i, u_i) = 0$$

3-D Robot Animation

Here is a video of our current simulation

- A key component is efficiently generating an initial guess
- We may consider pre-computing optimal paths

FIGURE 11.8 SCARA body-and-arm assembly (VRO).

Temporal Goal Planning

- Currently, our system finds an optimal path, grabs and moves an object, then repeats.
- With temporal goal planning, we can search several steps in advance for a more globally optimal solution
